

# Disaster Strikes! GDPS to the rescue!

Steven Cook

GDPS Software Development

Client Technical Advocate

IBM

[cooksd@us.ibm.com](mailto:cooksd@us.ibm.com)

# Abstract

Overview of GDPS

GDPS xDR solution (Synergy between GDPS and VM)

How to debug your VM GDPS environment with advanced log retrieval

How to save LinuxONE systems from an outage

GDPS LCP & Cyber Resiliency

Red Hat OpenShift Container Platform (RHOCP) and GDPS.

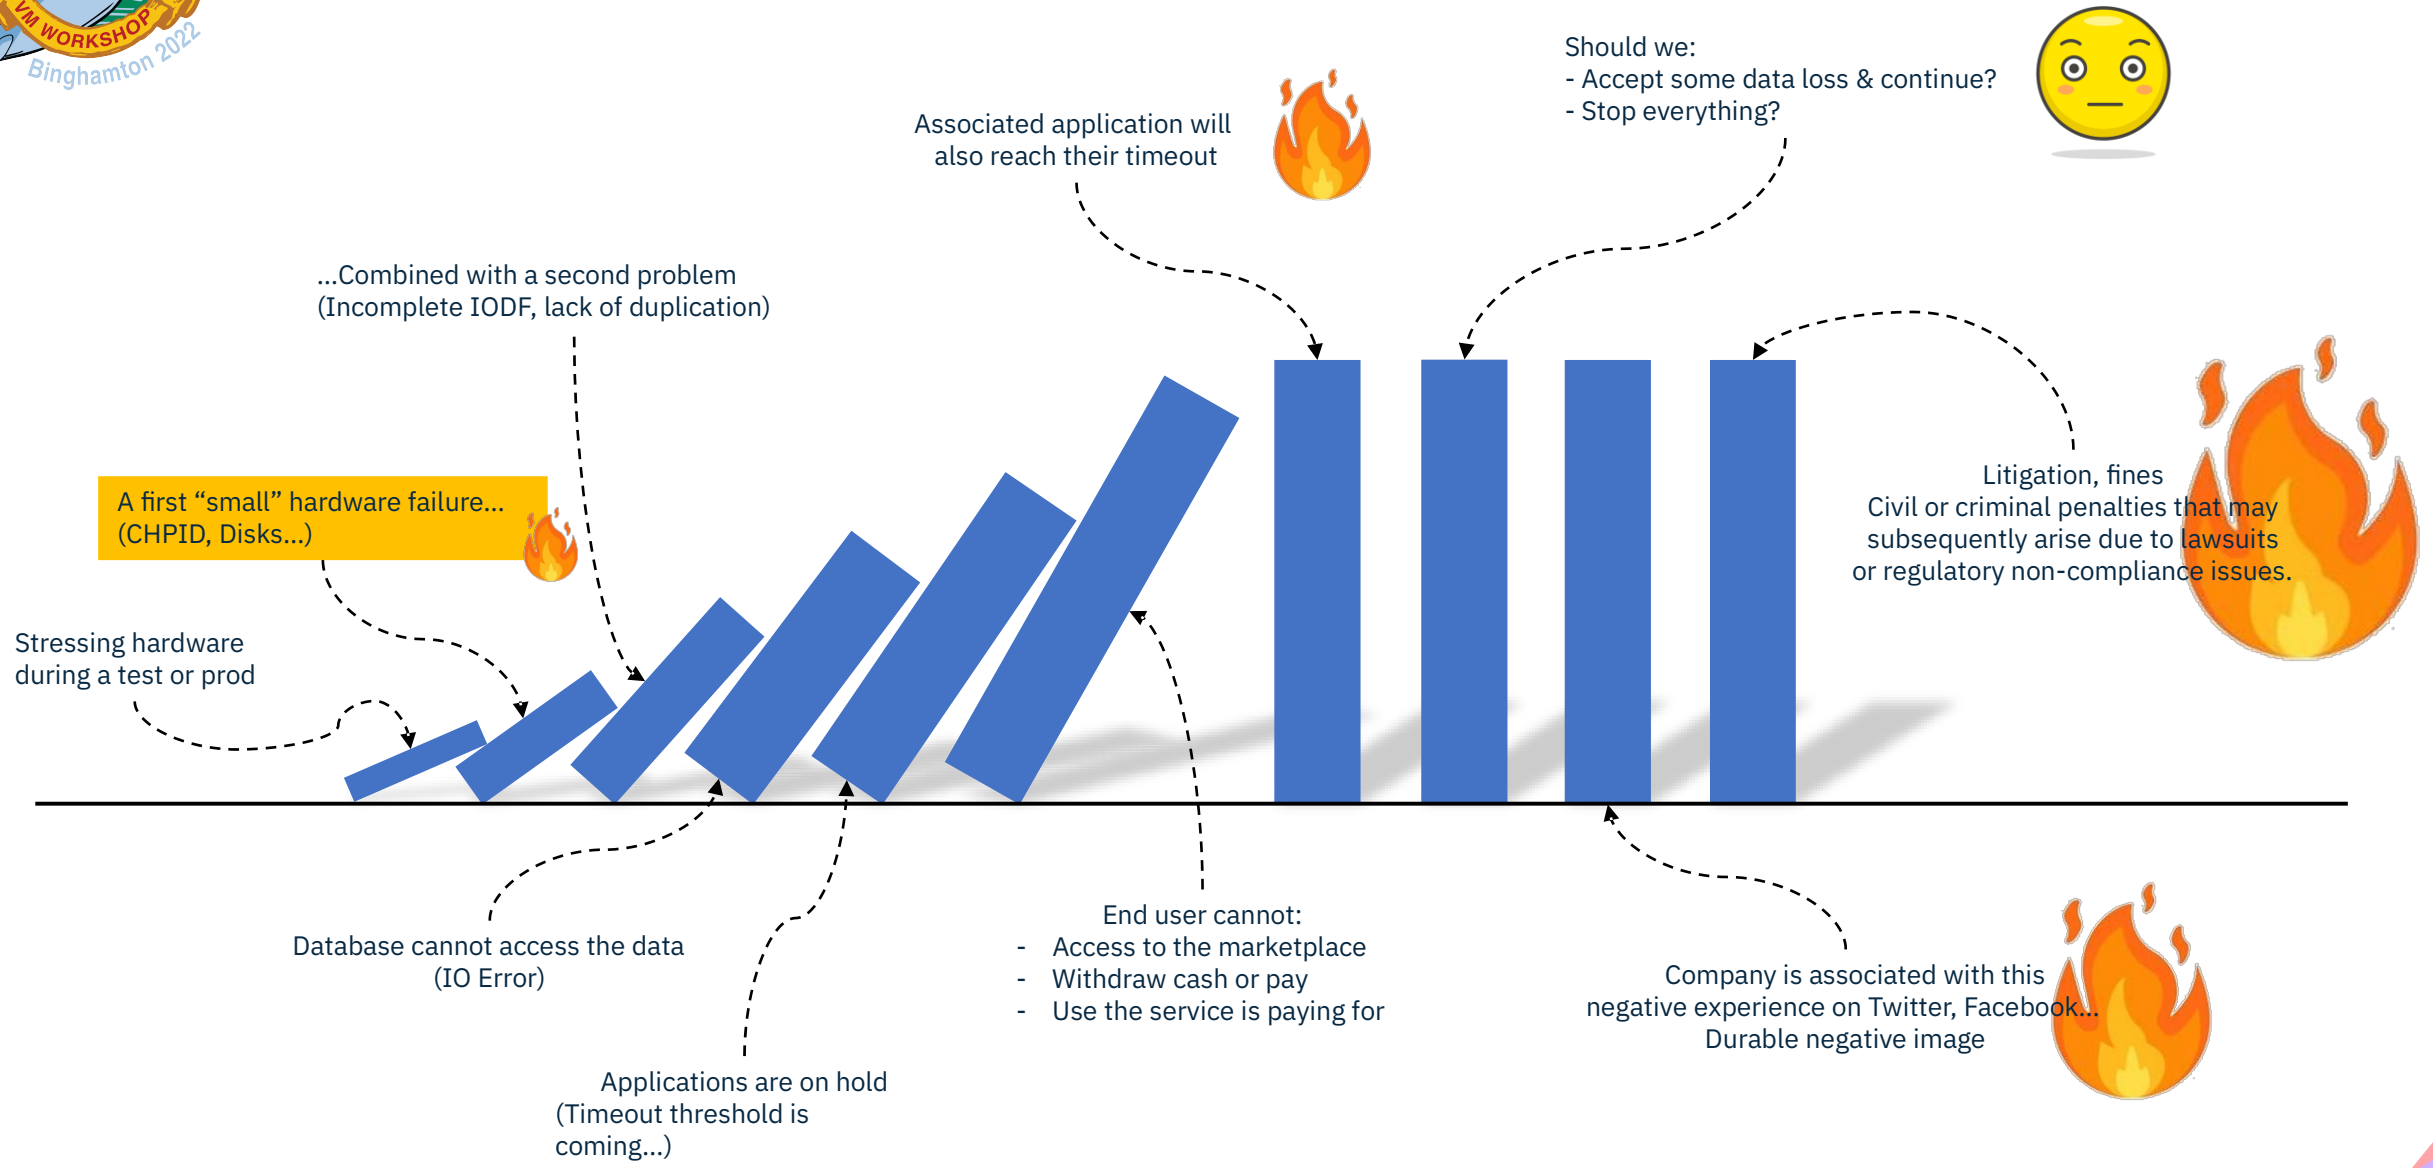

# GDPS Overview

# The "small hardware problem"

# When do we need a CA/DR solution?

## Global disaster

- Hurricane
- Earthquake
- Power plants failure..

Do we have safe backup?  
Do we have system ready to start outside of the region?

## Local disaster

- Fire
- Power supply problem
- Unplanned IT Failure

Could we avoid downtime and data loss?  
Is there a procedure to restart systems?

## Maintenance

- Hardware & software update.
- Switch to a new datacenter
- Test

Can we do that transparently?  
How to reduce the risk of a rolling problem during a maintenance scenario?

# Built for continuous availability and disaster recovery

## Automation

Automate actions

React to events

Synchronize operations

## Single point of control

Clear view of your systems and storages devices status

Simply presents faults and warnings

Heterogeneous type of storage (IBM DS8K, Hitachi, EMC disk...)

Heterogeneous platform (z/OS, KVM, zVM, Linux, SSC, zCX)

Metro configuration  
Continuous Availability

Global configuration  
Disaster Recovery

# Handling complex situation

- Most of the time, problems strike us from multiple side at the same time
  - Data replication
  - Sysplex outage
  - Data corruption
- GDPS has built-in function to handle this as automatically and simply as we want.
- Built-in function to start complex recovery procedure without having to manually do anything

- Metro Mirror = synchronous - Near CA solution  
- Global Mirror = asynchronous - DR  
- Both solutions can be combined to reach the highest level of resilience.

# GDPS: a family of solutions designed to address different requirements and topologies

## GDPS Metro

**Near-continuous availability (CA) and disaster recovery (DR) within a metropolitan region**

**Two data centers**  
Systems can remain active  
Multisite workloads can withstand site and storage failures

**DR RPO equals 0 and RTO is less than 1 hour or  
CA RPO equals 0 and RTO minutes**

## GDPS Global

**Disaster recovery at extended distance**

**Two data centers**  
More rapid systems disaster recovery with "seconds" of data loss  
Disaster recovery for out-of-region interruptions

**RPO seconds and RTO less than 1 hour**

## GDPS Metro Global 3 or 4-site

**Near-continuous availability (CA) regionally and disaster recovery (DR) at extended distance from either region**

**Three or Four data centers**  
Near-continuous availability (CA) and Disaster recovery (DR) when running from any site

**Designed for near-continuous availability within either region and RPO seconds and RTO less than one hour for unplanned region fail-over**

## GDPS Continuous Availability

**Near-continuous availability, disaster recovery, and cross-site workload balancing at extended distance**

**Two or more data centers**  
Disaster recovery for out-of-region interruptions  
All sites active

**RPO zero or seconds and RTO seconds**

# Restful API

- Most of the functions are now available thru a Restful API
- Encourage synergy between GDPS and other solutions
- Design your own interface to fit your requirements

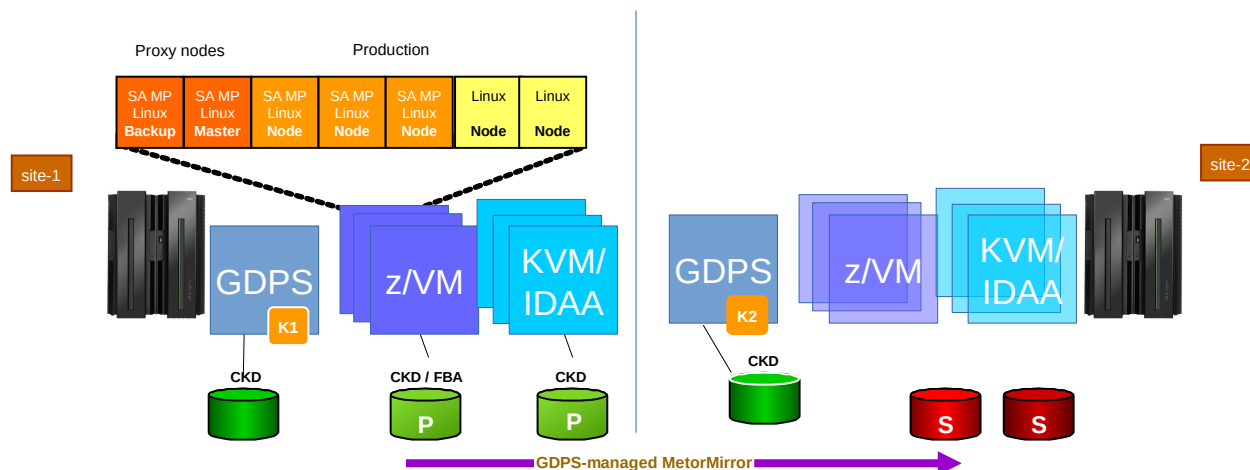

# GDPS xDR solution (Synergy between GDPS and VM)

# GDPS xDR: z/VM Linux Guests

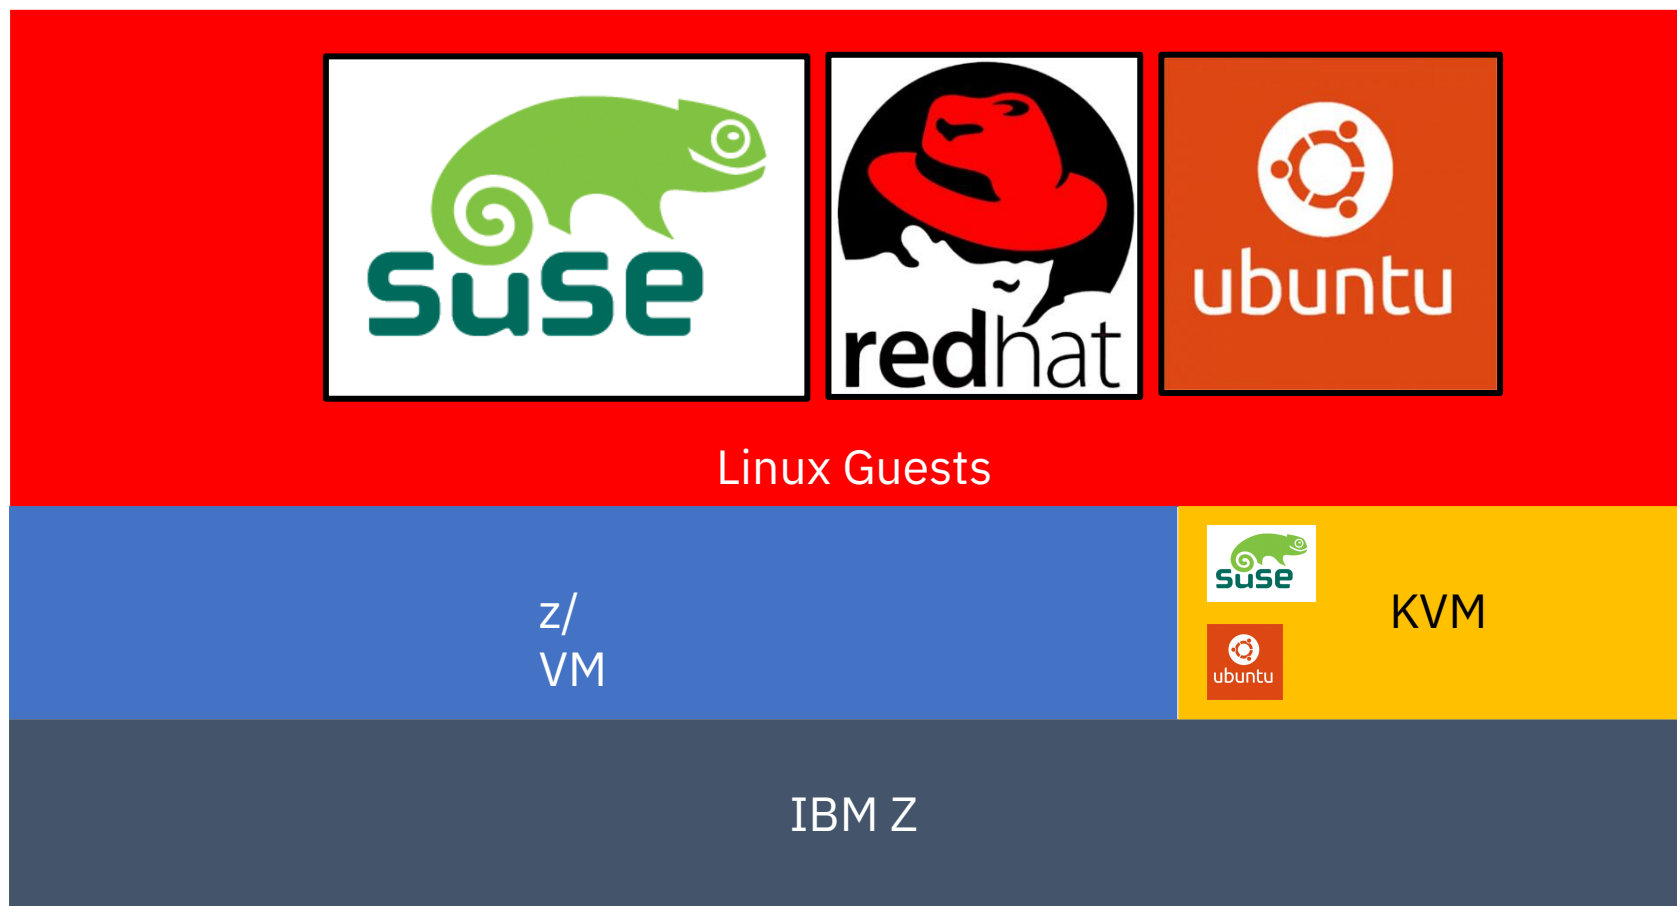

- Coordinated HyperSwap – z/OS, z/VM with its guests
- Graceful shutdown and startup (re-IPL in place) of Linux clusters or nodes
- Coordinated takeover – recovery from a Linux node or cluster failure
- Multiple Linux clusters are supported, as are multiple z/VM systems & Linux LPARs
- All members of a SA MP cluster must run under same z/VM system or SSI
- SSC (vIDAA) in a Metro, MGM 3-site and 4-site configuration
- View z/VM System and xDR Proxy
- HyperSwap planned/unplanned
- Site Switch planned/unplanned
- Freeze planned/unplanned
- Start/Stop z/VM image
- Live Guest Relocation
- RESTful API provided for GDPS

**Coordinated recovery for planned and unplanned events**

# Integration of distros of Linux guests (xDR and GVA)

**Note:**

**For z/VM,** xDR proxies are located in the Linux Guest (Suse or Redhat)

**For KVM,** xDR proxies are located in KVM

# How to debug your VM GDPS environment with advanced log retrieval

# Problem determination

GDPS provides a number of aids for problem determination:

- xDR Configuration Verification Programs
- xDR Monitor alerts can be found in the NetView log and can additionally be sent to a z/VM operator
- The GDPS xDR Status panel. (The last signal GDPS received about that node, or the last command GDPS sent to the node is also displayed and useful)
- GDPS Debug with the option of verbose tracing to a dataset
- Tracing of SA MP xDR components
- The **xdrstatus** command
- The **xdrgetlogs** command
- First Failure Data Capture (FFDC) messages can be found in the NetView log of the GDPS Master system (written to the Netview log using operator AUTLXX2, which you can filter on)

# Collecting xDR logs

The retrieval of z/VM, KVM, and IDAA proxy logs from GDPS is enhanced to allow administrators to collect Proxy-related data directly from GDPS panel without the need to involve administrators of distributed systems.

All the collected data is put in a tar file. You can either trigger collecting logs from xDR nodes by using the CL action on the xDR panel, which will also allow you to transfer the created tar file to Controlling system, or call `xdrgetlogs` on the node.

```
xdrgetlogs
-----
collecting logs for xDR...
-----
The collected debug data is available as /tmp/xdrlogs-2022-06-15-22.12.tar
```

# How to save LinuxONE systems from an outage

# GDPS Virtual Appliance

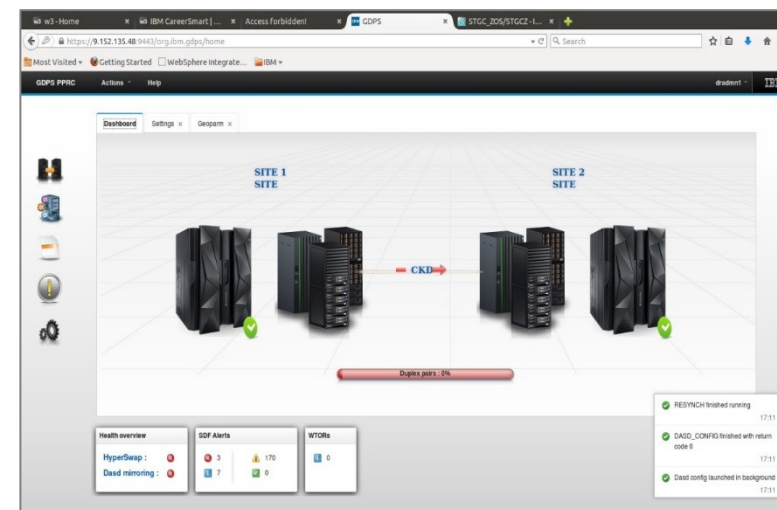

- Brings High Availability and disaster recovery capabilities of IBM Z to Linux-only enterprises and Linux-only systems
- No z/OS skills required!
- Years of Intellectual Capital invested in GDPS logic available providing
  - Ability to avoid impact cause by primary disk outage (planned or not)
  - Scripted automation
- Monitoring and central point of control provided thru the GDPS interface

# GDPS Virtual Appliance

## Operate GDPS using the GDPS web GUI

- View z/VM System and xDR Proxy
- HyperSwap planned/unplanned
- Site Switch planned/unplanned
- Freeze planned/unplanned
- Start/Stop z/VM image
- Start/Stop z/VM guest(s)
- Manage Linux clusters
- Live Guest Relocation

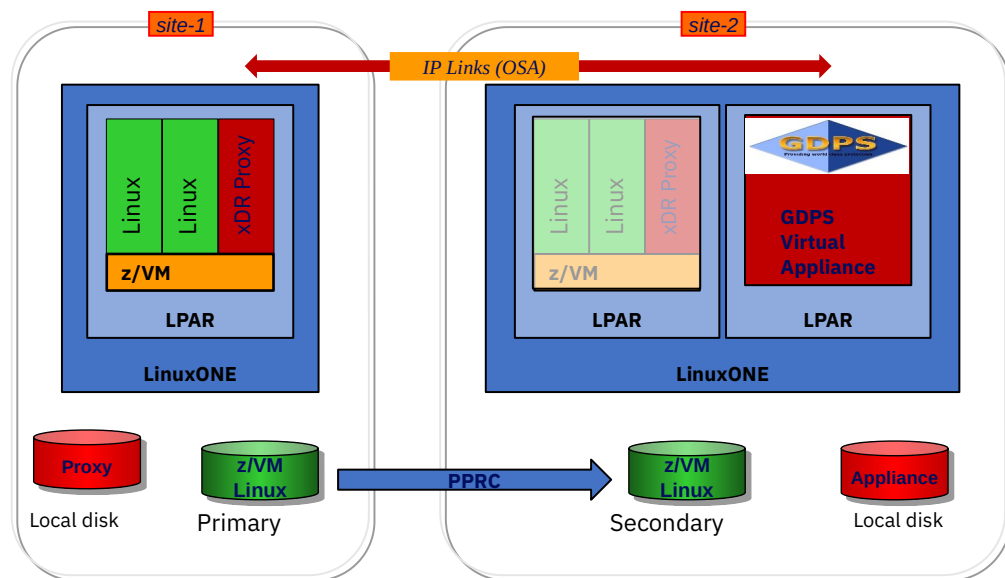

**Provides non-z/OS customers the same benefits of high availability and D/R which were only available to z/OS customers**

**Provides additional benefit for moving workloads to Linux on IBM Z**

# GDPS Virtual Appliance: GDPS/Metro xDR capabilities for z/VM & Linux on z Systems clients who do not use z/OS

A comprehensive continuous availability and disaster recovery solution for z/VM clients

- **Monitors and manages**
  - PPRC replication management
  - Secondary data consistency
  - Planned and unplanned HyperSwap
- **System and Hardware management capabilities**
  - Intuitive graphical user interface
  - Simple scripting capability

Crippled ports. Paralyzed corporations. Frozen government agencies. How a single piece of code crashed the world.

# GDPS with Logical Corruption Protection

1. GDPS now includes Logical Corruption Protection support to protect against cyber attacks and more.
2. A licensed offering that can be deployed in a range of different GDPS solutions.
  - LCP-Manager(MM) and LCP-Manager(GM)
3. Provides the ability to secure Point-In-Time captures of critical data using either FlashCopy or Safeguarded Copy.
4. These Point-In-Time captures can be used for a variety of purposes

## Catastrophic

Recover the entire environment back to the point in time of the copy as this is the only recovery option

## Forensic

Recover the copy and use the copy to investigate the problem and determine what final recovery action is required.

## Surgical

Extract data from the copy and logically restore back to the production environment

## Validation

Regular analytics on the copy to provide early detection of a problem or reassurance that the copy is a good copy prior to a further action

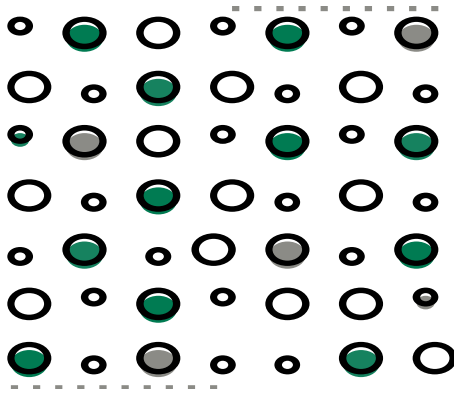

## Offline Backup

Backup the copy of the environment to offline media to provide a second layer of protection

# Required Characteristics for Protection Copies

## Granularity

LCP must be able to create multiple secure copies to minimize data loss in the event of a corruption incident

## Isolation

The secure copies must be isolated from the active production data so that it cannot be corrupted by a compromised host system. This is also known as an Air Gap solution

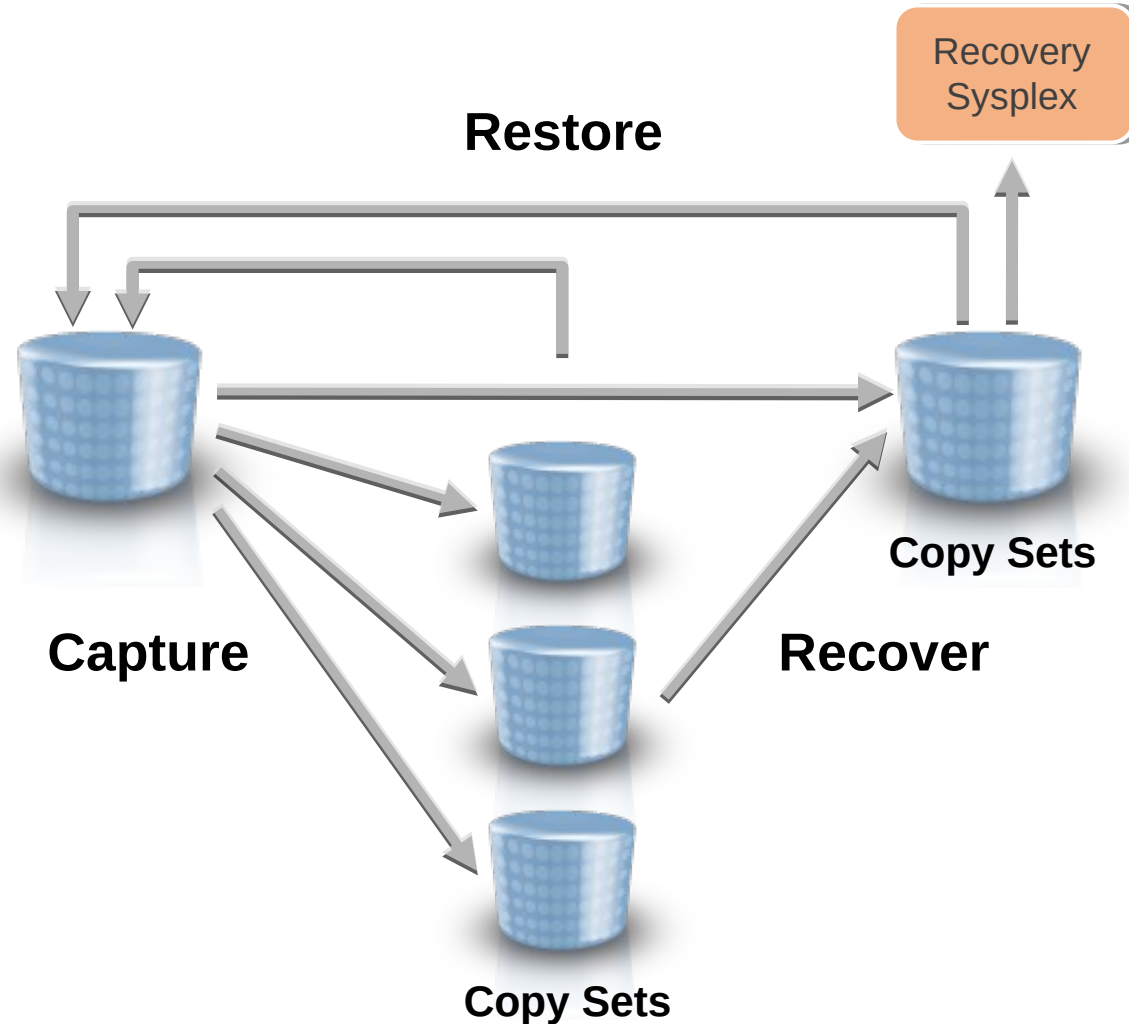

## Immutability

The secure copies must be protected against unauthorized manipulation .

# The Anatomy of LCP

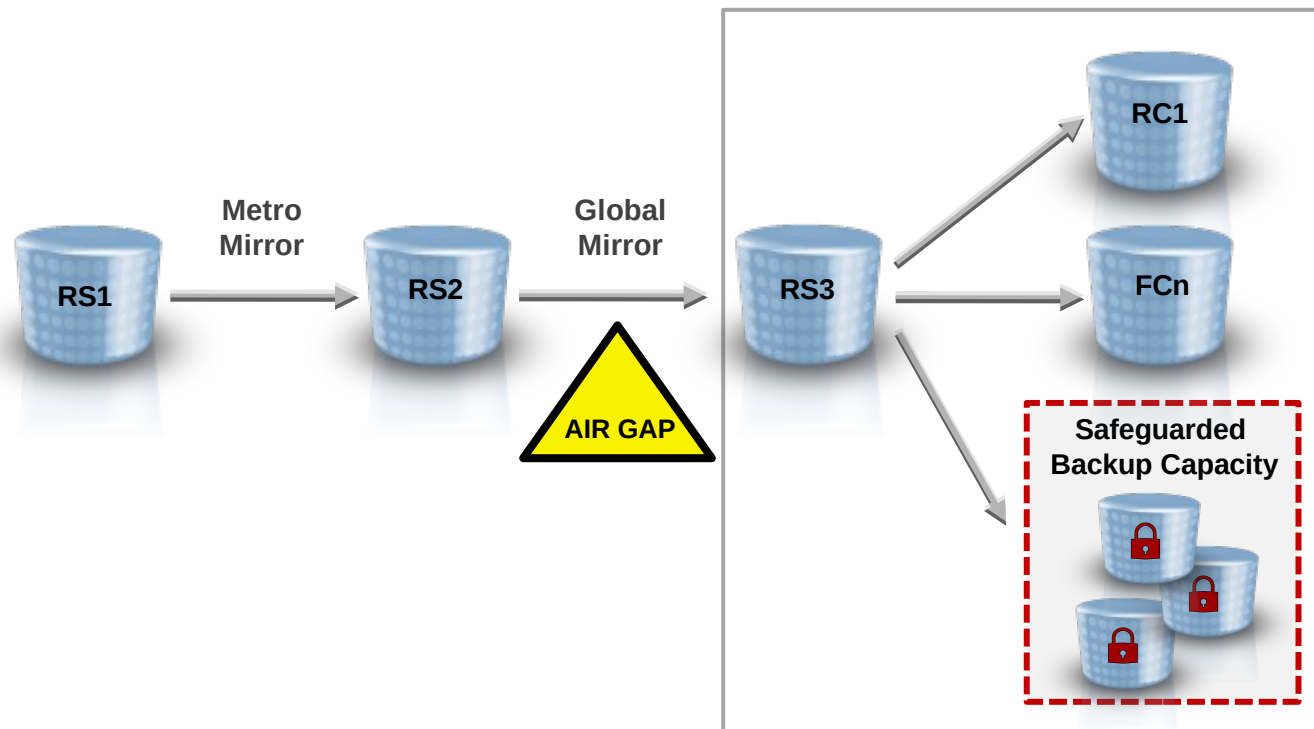

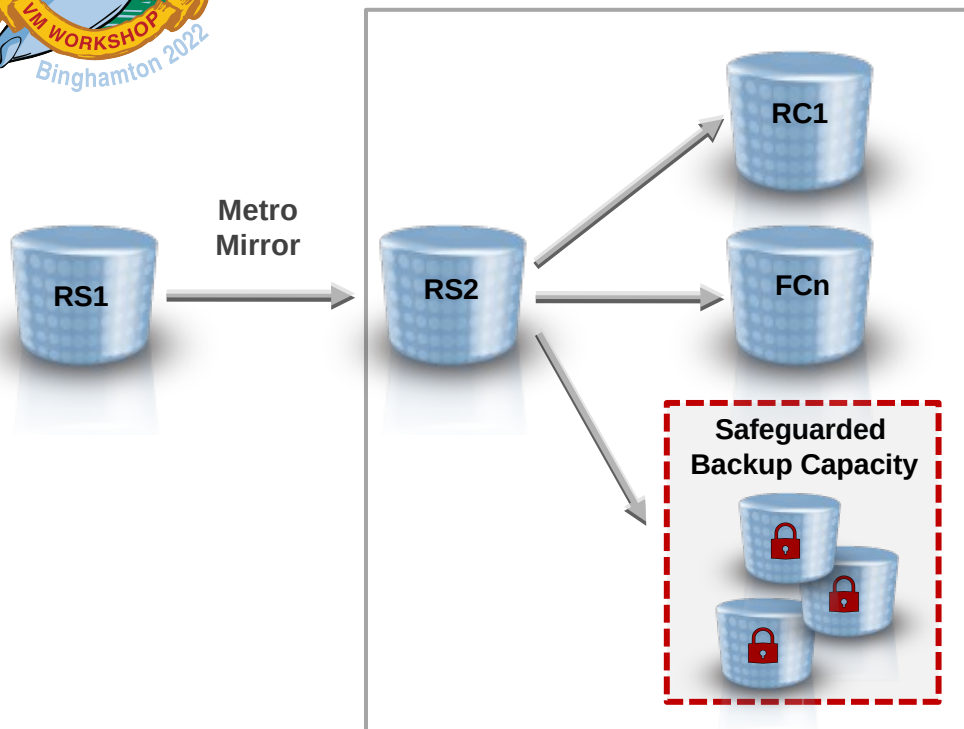

Source devices are where the copies are taken from. These could be production volumes in a virtual isolation environment or a staging volume where the environment is physically isolated. The source volumes inherit the security/protection provided by the production environment policies and capabilities.

Recovery devices enable the IPL of systems for data validation of the backup copy, forensic analysis of a potential corruption event or other recovery purposes.

Protection/Backup capacity provides one or more logical protection Point-In-Time copies which are not accessible by any systems. Additional security measures aim to protect these from inadvertent or malicious actions.

# Virtual versus Physical Isolation

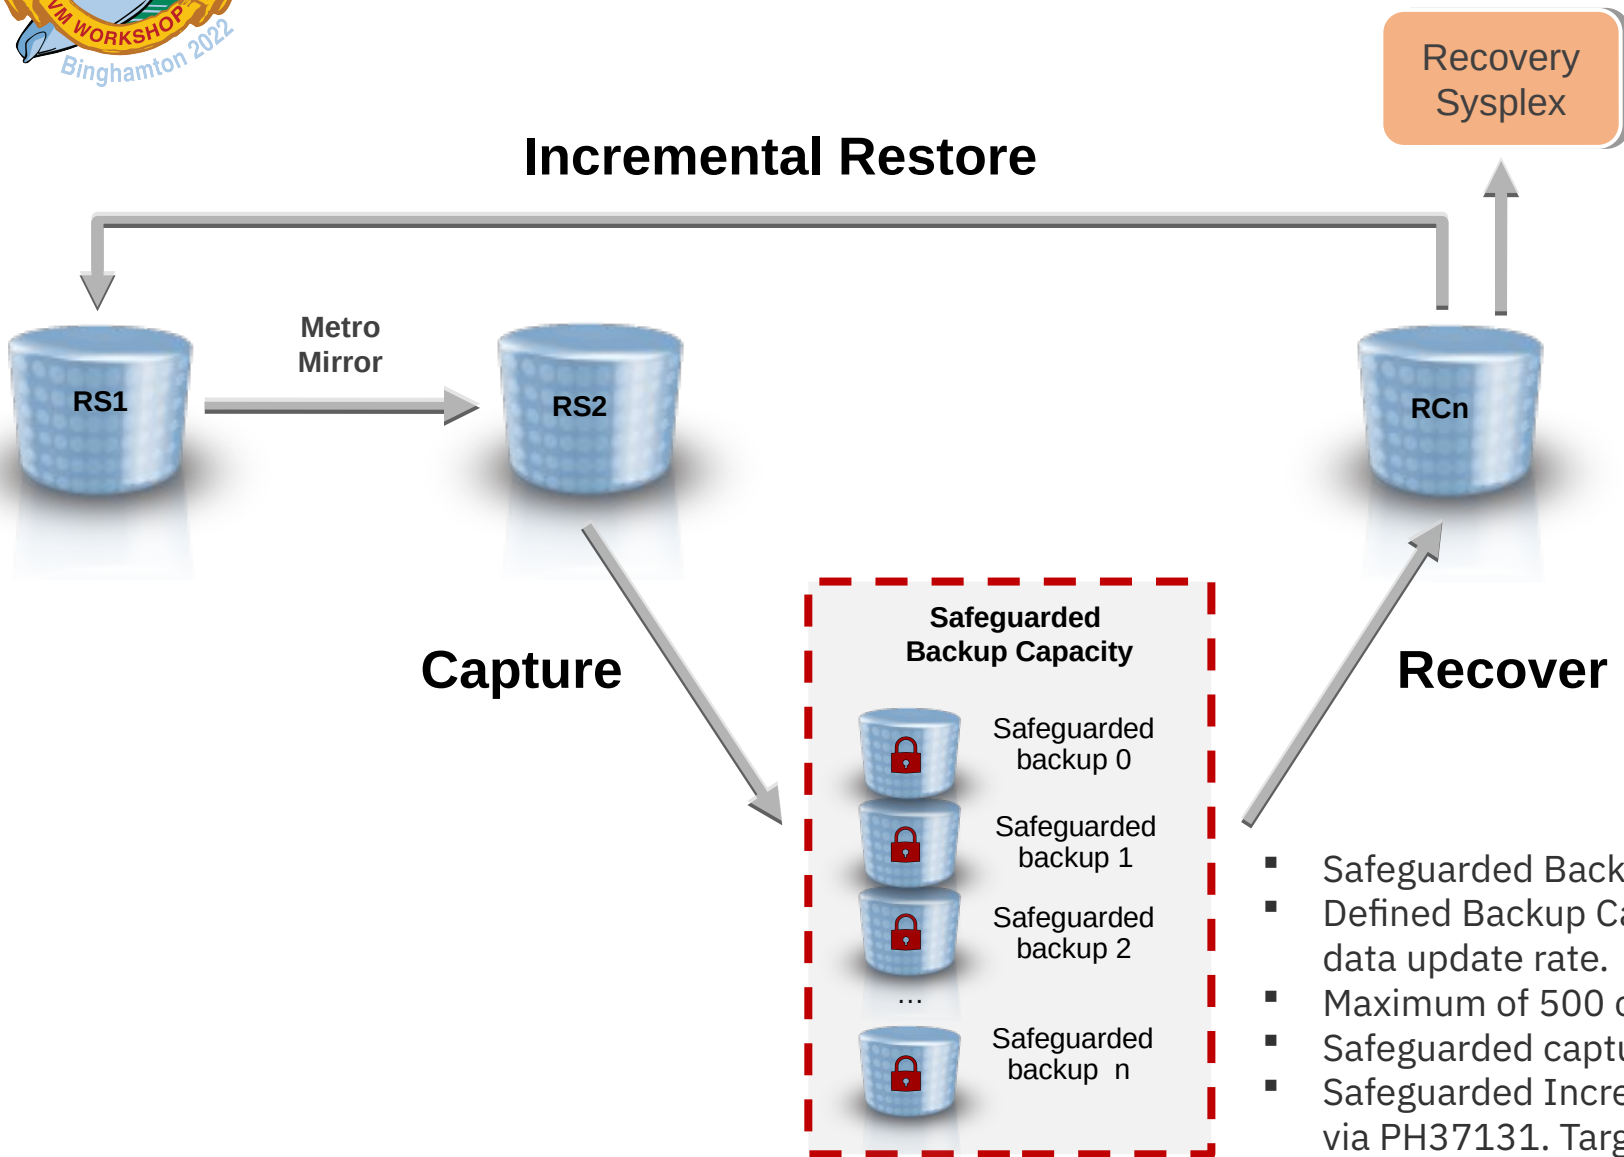

- The protection copies are created in one or more storage systems in the existing HA and DR topology.
- The storage systems typically reside in the same SAN and TCP/IP network as the production environment.
- **Potential performance impact during the capture process.**

- Additional storage systems are used for the protection copies.
- The storage systems do not typically reside in the same SAN or TCP/IP network as the production environment.
- The storage systems have restricted access and even different administrators to provide separation of duties.
- **No performance impact during the capture process.**

# Safeguarded Copy Sets

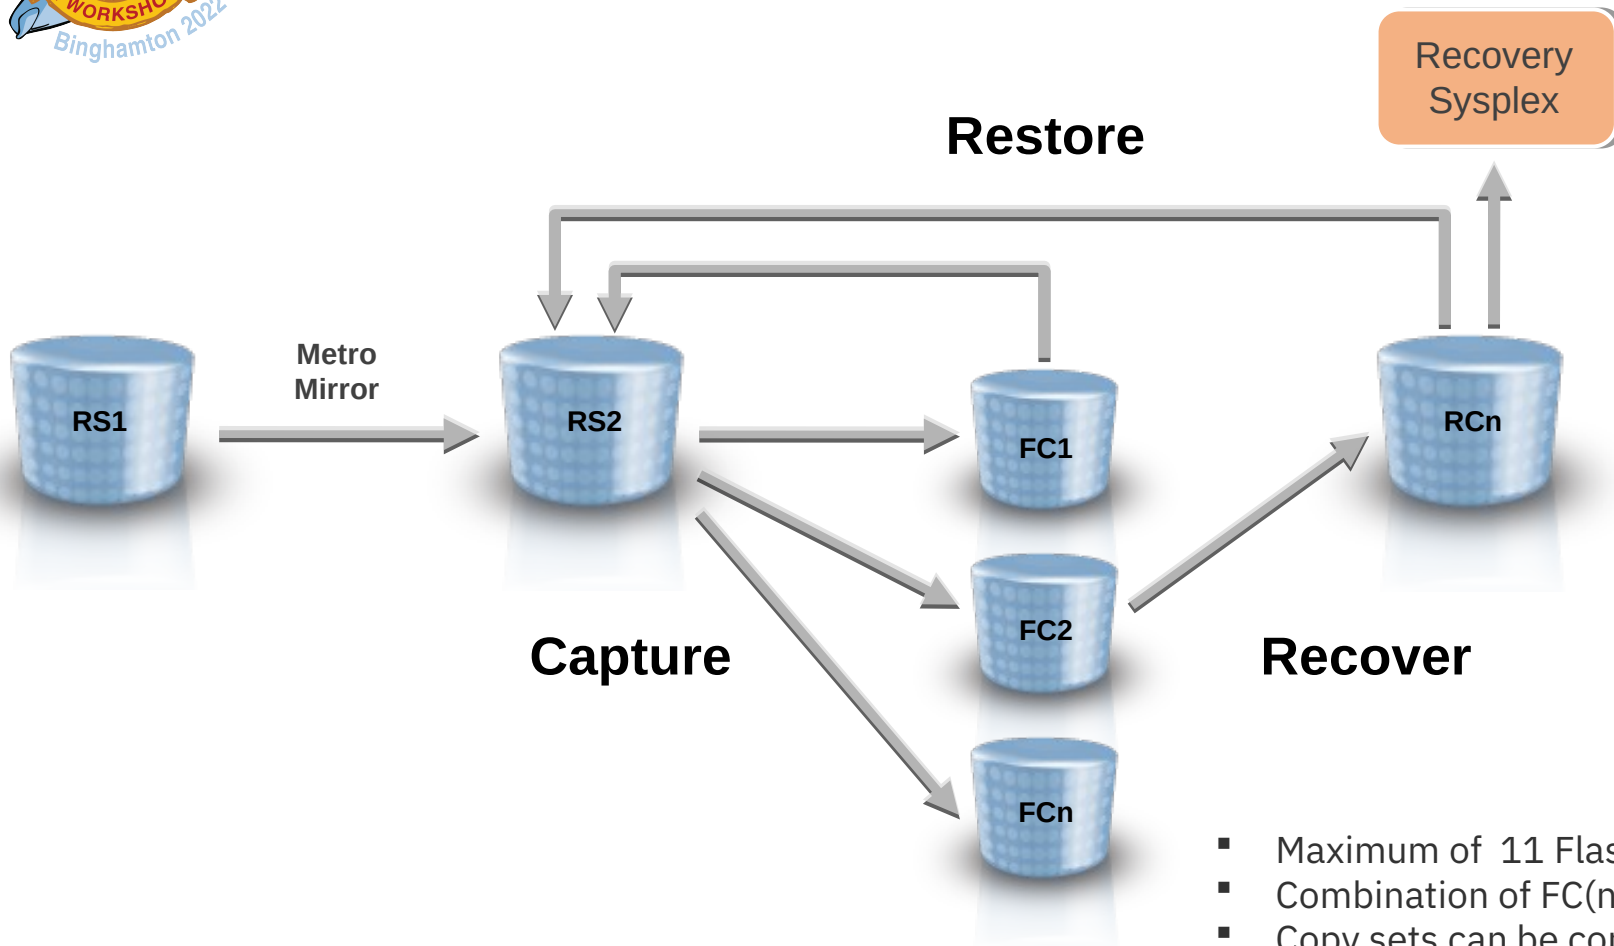

## Incremental Restore

- Safeguarded Backup Capacity must first be configured on DS8000.
- Defined Backup Capacity should be based on retention period and data update rate.
- Maximum of 500 captures supported.
- Safeguarded captures can be recovered.
- Safeguarded Incremental Restore to Production will be supported via PH37131. Target date November 2021

# FlashCopy Copy Sets

- Maximum of 11 FlashCopy sets supported
- Combination of FC(n) and RC(n)
- Copy sets can be configured and captured in both replication sites
- FlashCopy captures can be recovered and restored

# Modify a Management Profile

```
VPCMPMS                Logical Corruption Protection                AZK1

You have requested the modification of an LCP Management profile

Management Profile: GOLD_SGC_RS2                Profile name
Consistency Group: PRODUCTI                    Consistency Group name
Replication Site: 2                            Replication site number

Capture Type: SAFEGUARD                        SafeGuard capture profile
Retention Period: MINUTE(1)                   Retention period for all captures
Minimum Interval: MINUTE(1)                   Minimum interval between captures
Copy Set: 1                                    Copy set assigned to this profile
Reservation Time: 0600                          Maximum Reservation Scan elapsed time
Check In Time: 010                             Maximum Check In elapsed time

Enter NO to cancel or YES to proceed with the profile modification

Selection ==> yes_

F1=Help  F3=Return
```

**Manage Profile name, consistency group, and replication site**

**Safeguarded Copy or FlashCopy profile**

**Retention period of LCP captures, days, hours, minutes**

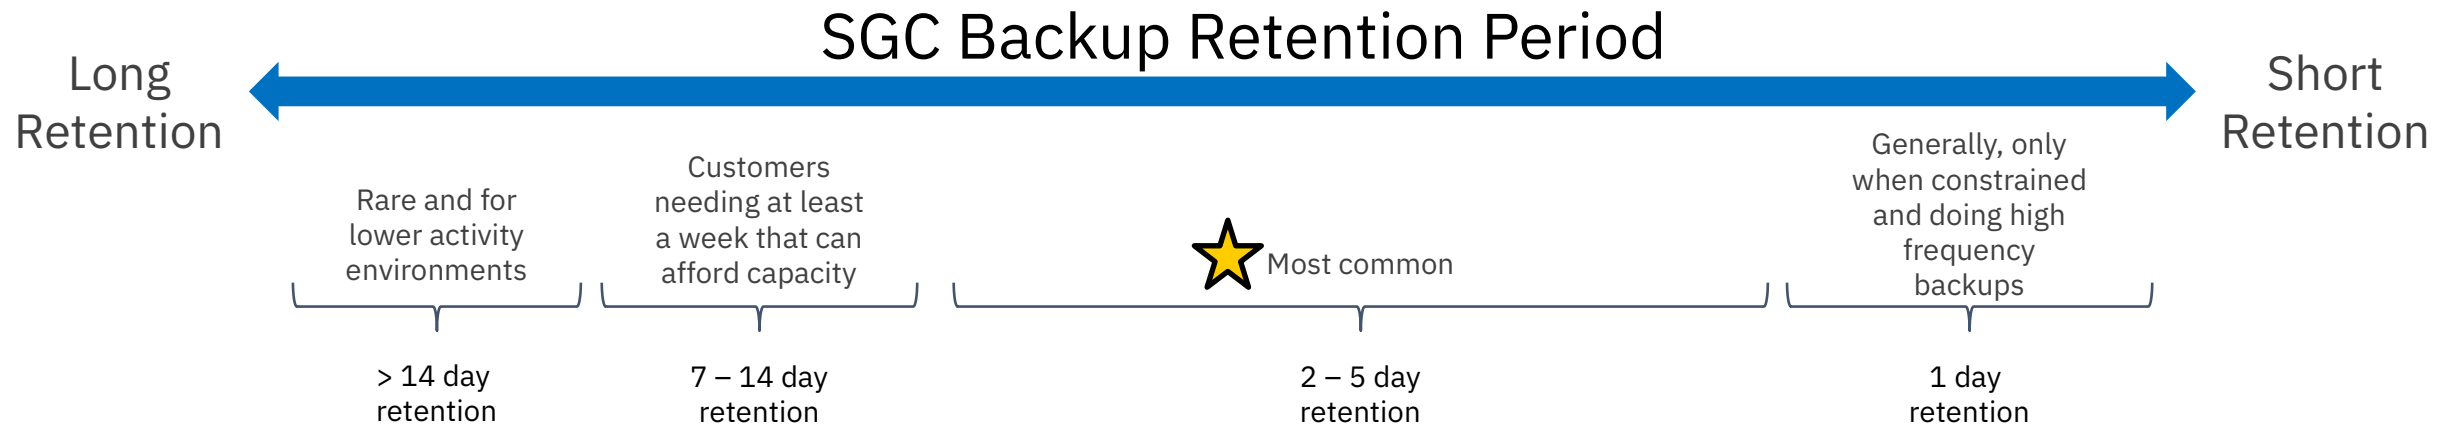

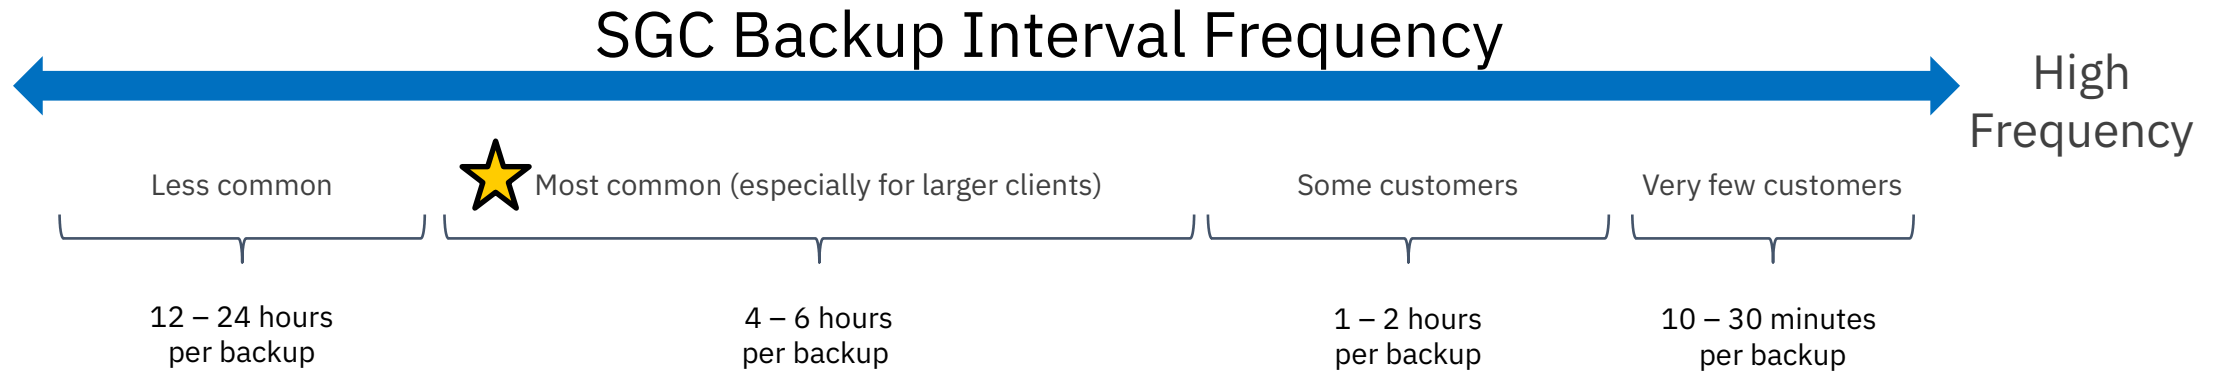

**Minimum elapsed time between successive LCP captures**

**Maximum permissible time for the reservation scan before the LCP Capture is aborted**

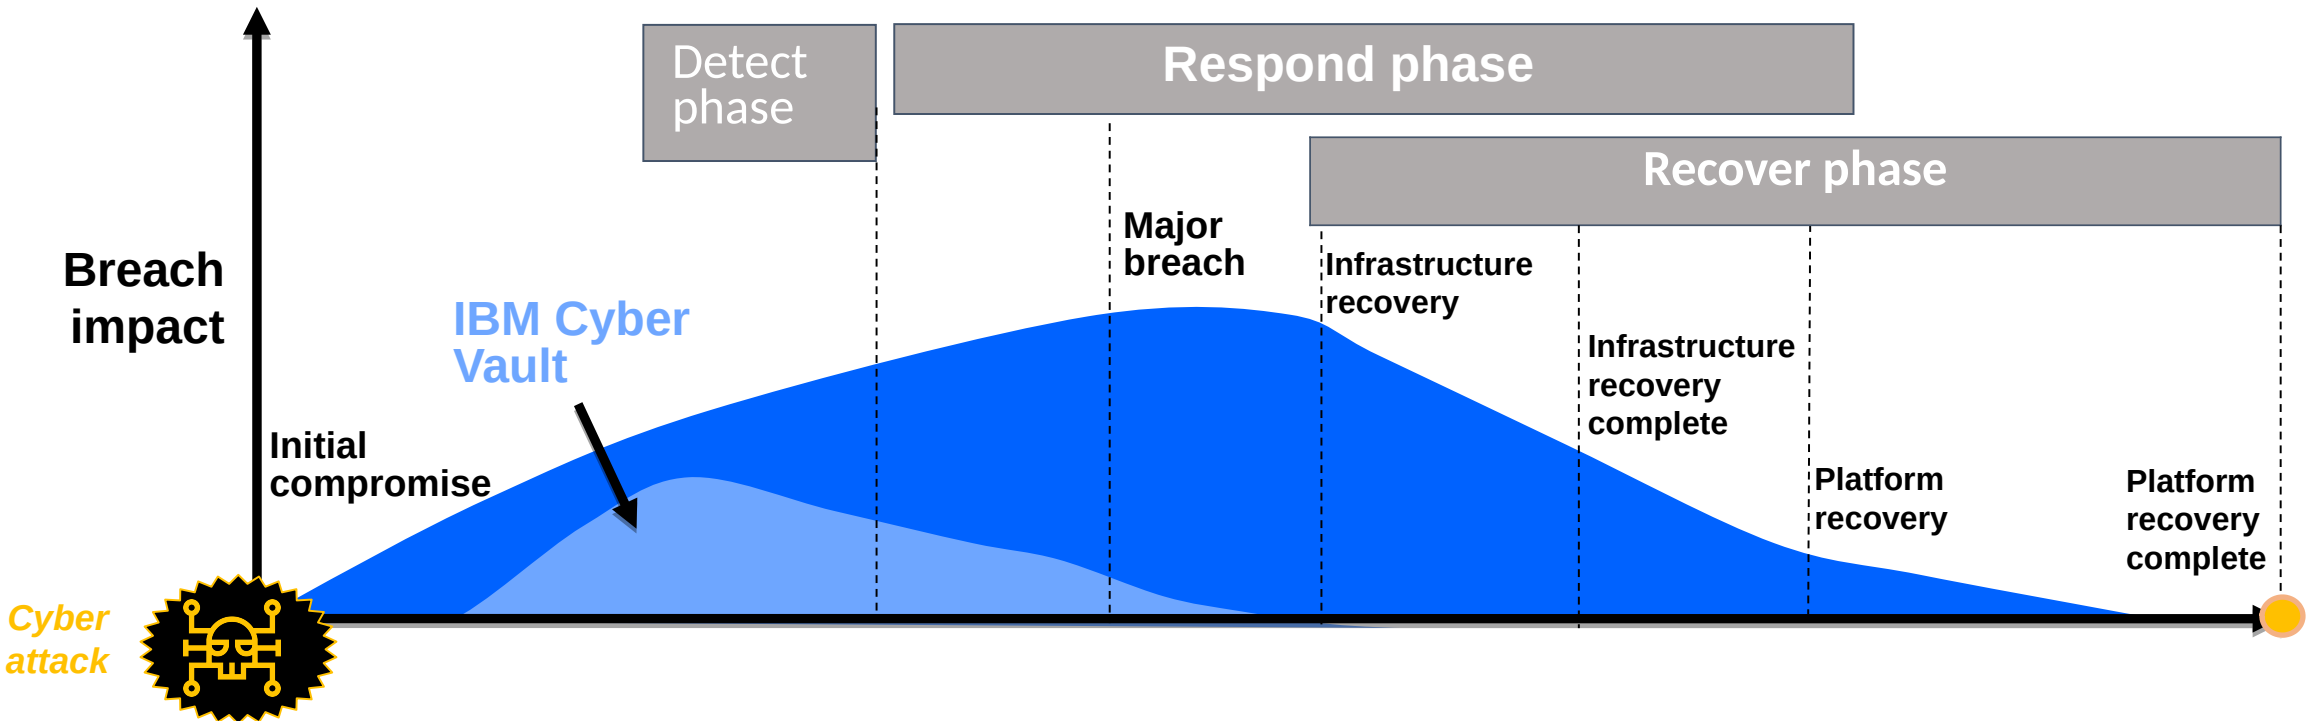

**Maximum permissible time for Check In before the LCP Capture is aborted**

# LCP Capture Frequency

# Speed recovery to significantly reduce the impact of breaches

Due to the Cyber Vault environment and the use of SafeGuarded Copy technology, data is continuously checked and corruption is found and can be corrected fast. Leading to a shorter impact time.

# Red Hat OpenShift Container Platform (RHOCP) and GDPS

# Red Hat Open Container Platform (RHOCP)

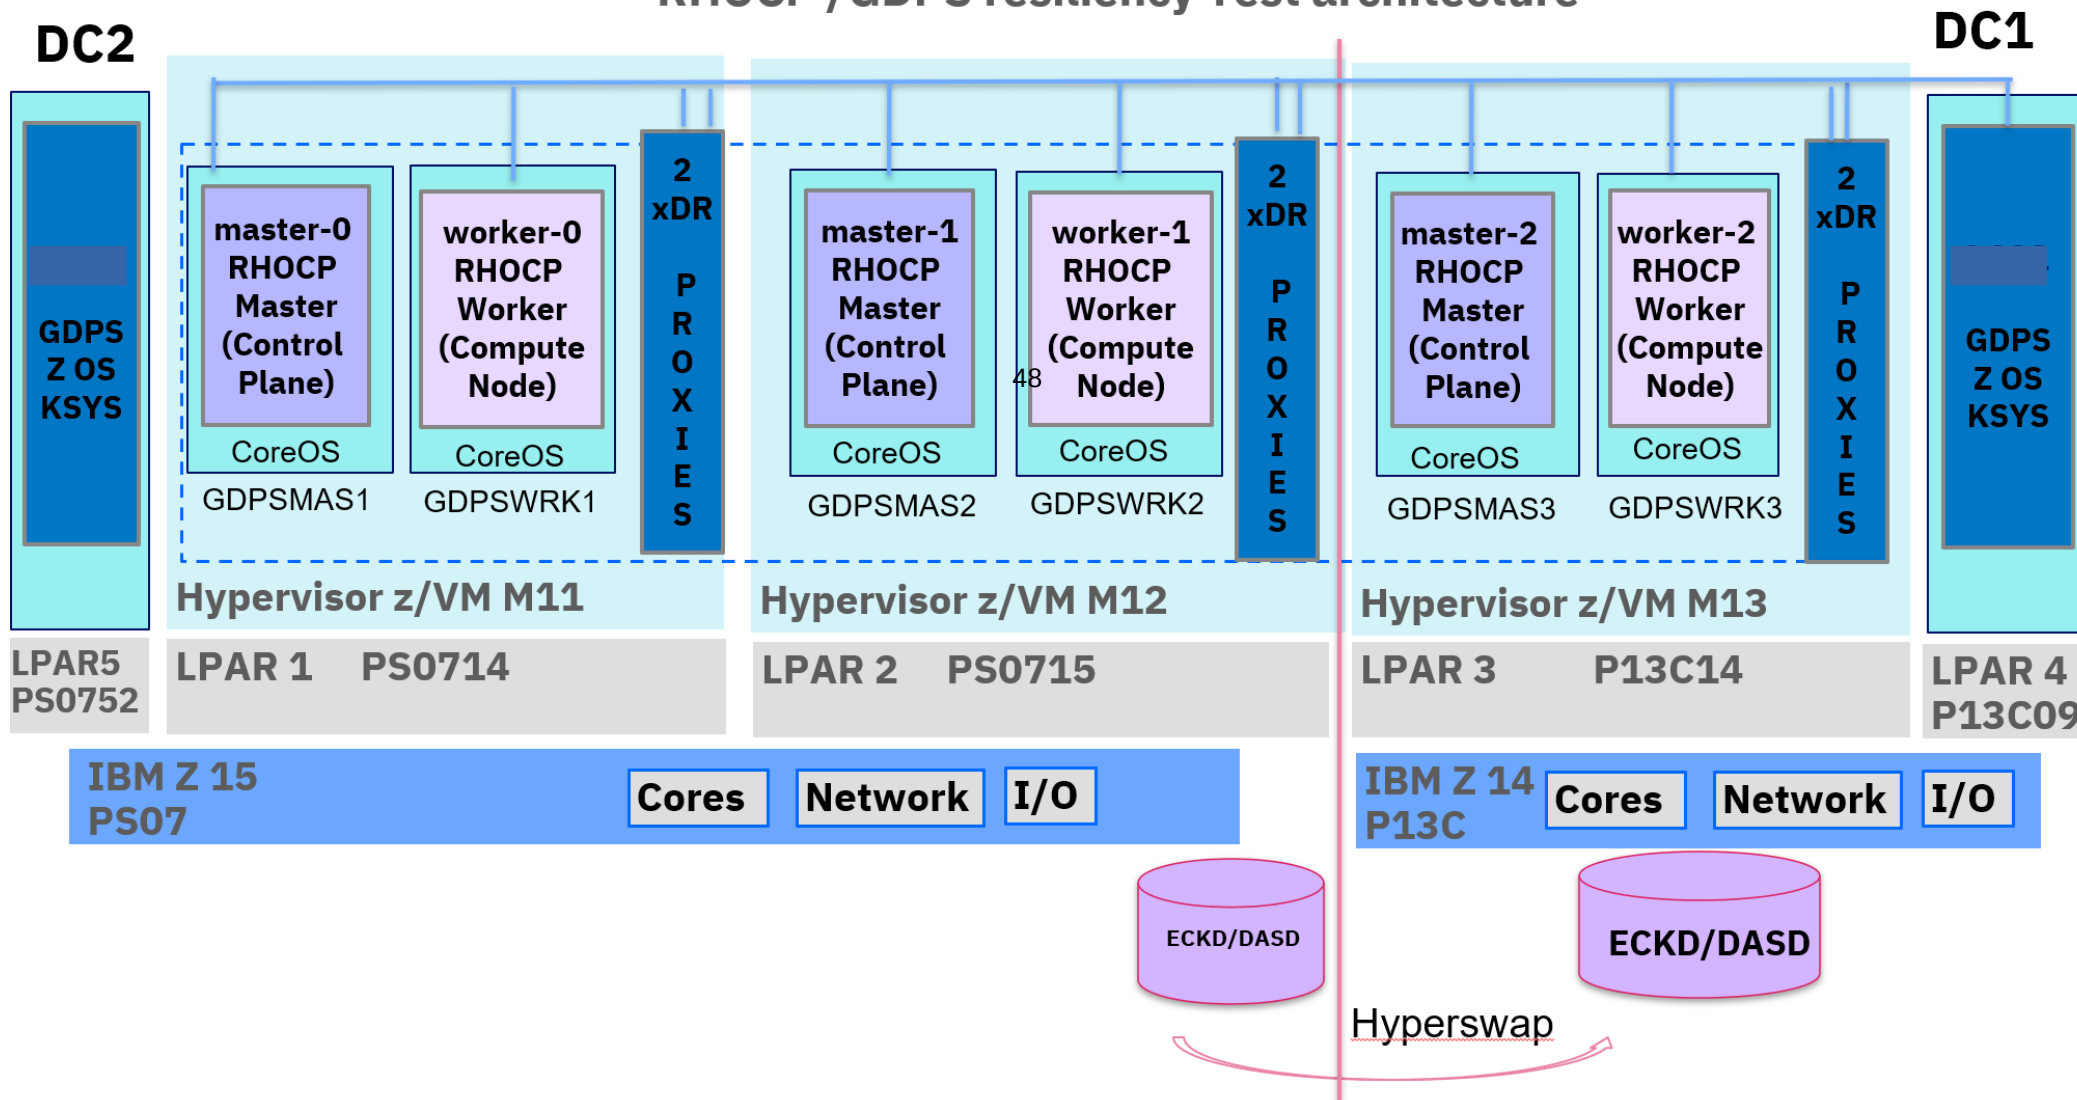

GDPS supports Red Hat OpenShift Container Platform (RHOCP) application environment (Master and Worker nodes) like any z/VM LPAR based application workload.

- **Mirroring of the RHOCP master and worker nodes DASD devices(Metro Mirror)**
- **Stop of a z/VM hosting a master and worker nodes**
- **Re Load of a z/VM hosting a master and worker nodes**
- **Stop of all z/VM hosting the complete RHOCP masters and workers nodes**
- **Live guest relocation of master and worker nodes on another z/VM member (planned maintenance)**
- **Coordinated planned HyperSwap**
- **Coordinated unplanned HyperSwap**
- **Coordinated takeover: unplanned Site failure**
- **Coordinated takeover: planned Site failure**
